

Ferrules for Pencils are metal arms that are crimped to hold an eraser on a pencil (like the left picture).

Ferrule Pencils are shaped and made using the stamping process. And DTI has worked on several components to make this pencil ferrule.

The challenge of this project is to have high precision and very small contours. DTI must ensure the pencil is inserted with an eraser.

This pencil is produced in big quantities and is marketed all around Indonesia.

We always try to do various kinds of requests from customers, such as design, component manufacturing, making molds or dies, or making special machines, manufacturing, and so on, because DTI offers the best engineering solutions to problems experienced by customers.
